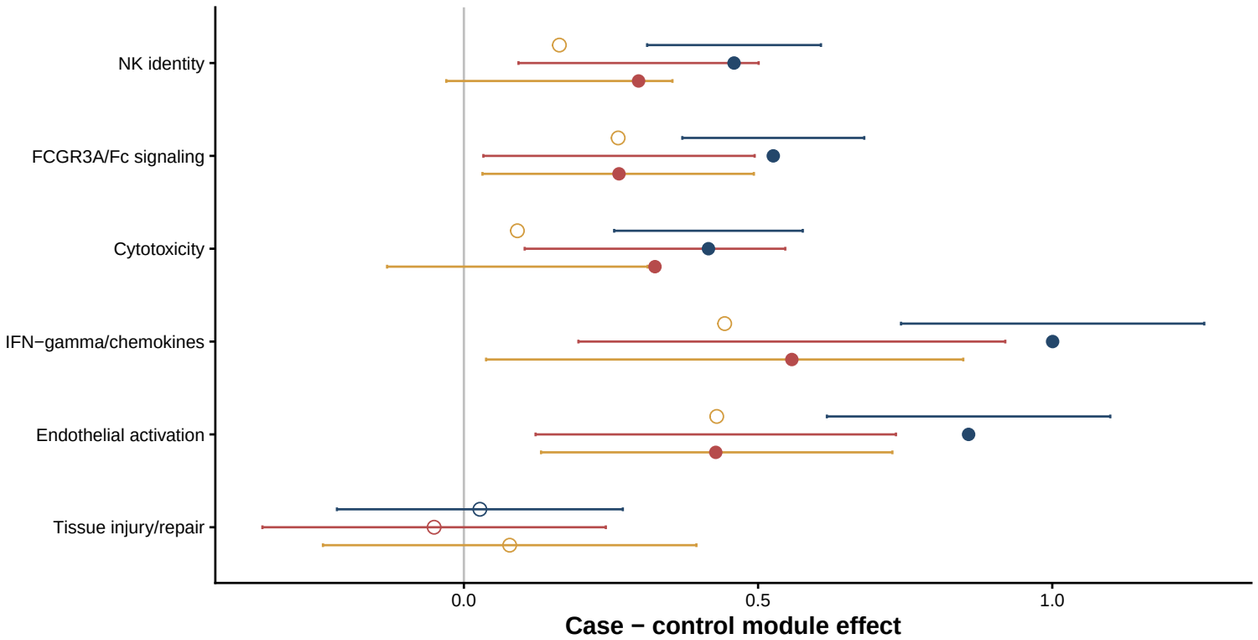
MOSAIC−Tx: qualification of a treatment−responsive rejection program

Effect estimates answer prespecified biological questions; descriptive PCA is excluded from the primary result

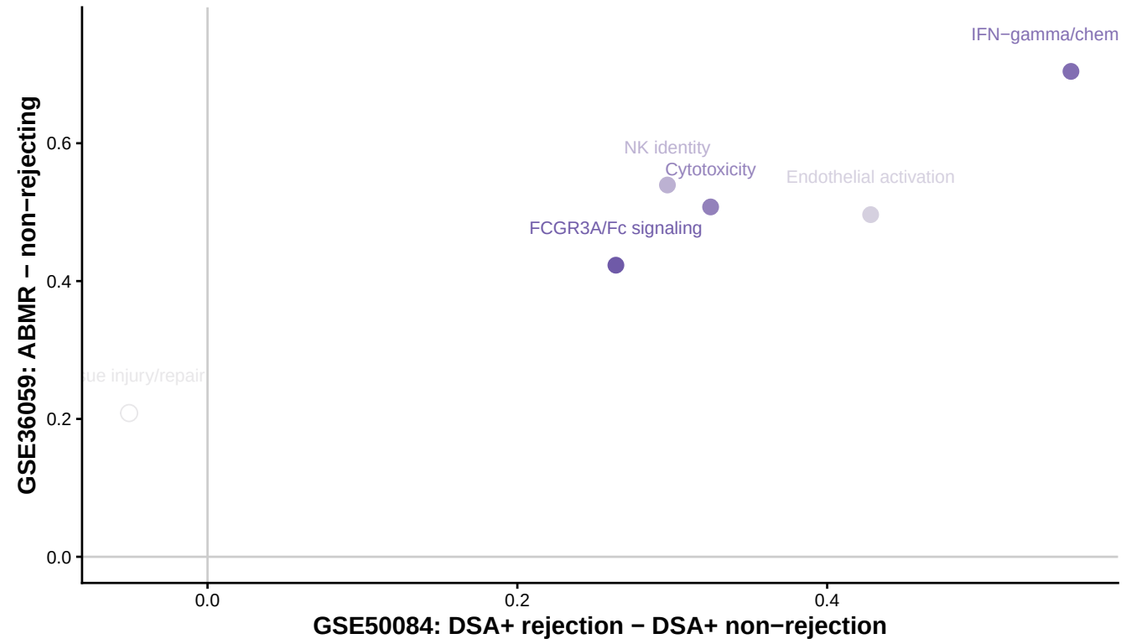
A DSA exposure is separated from damaging rejection

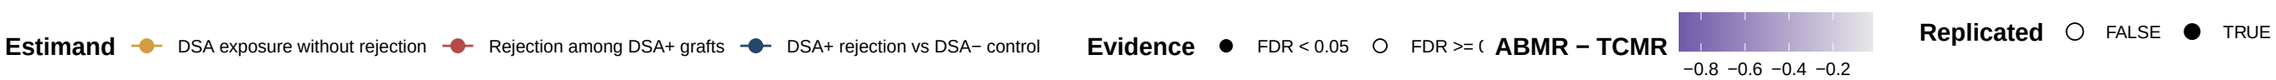
GSE50084, 61 primary biopsies; standardized module effects with approximate 95% CI



B Replication is challenged for rejection specificity

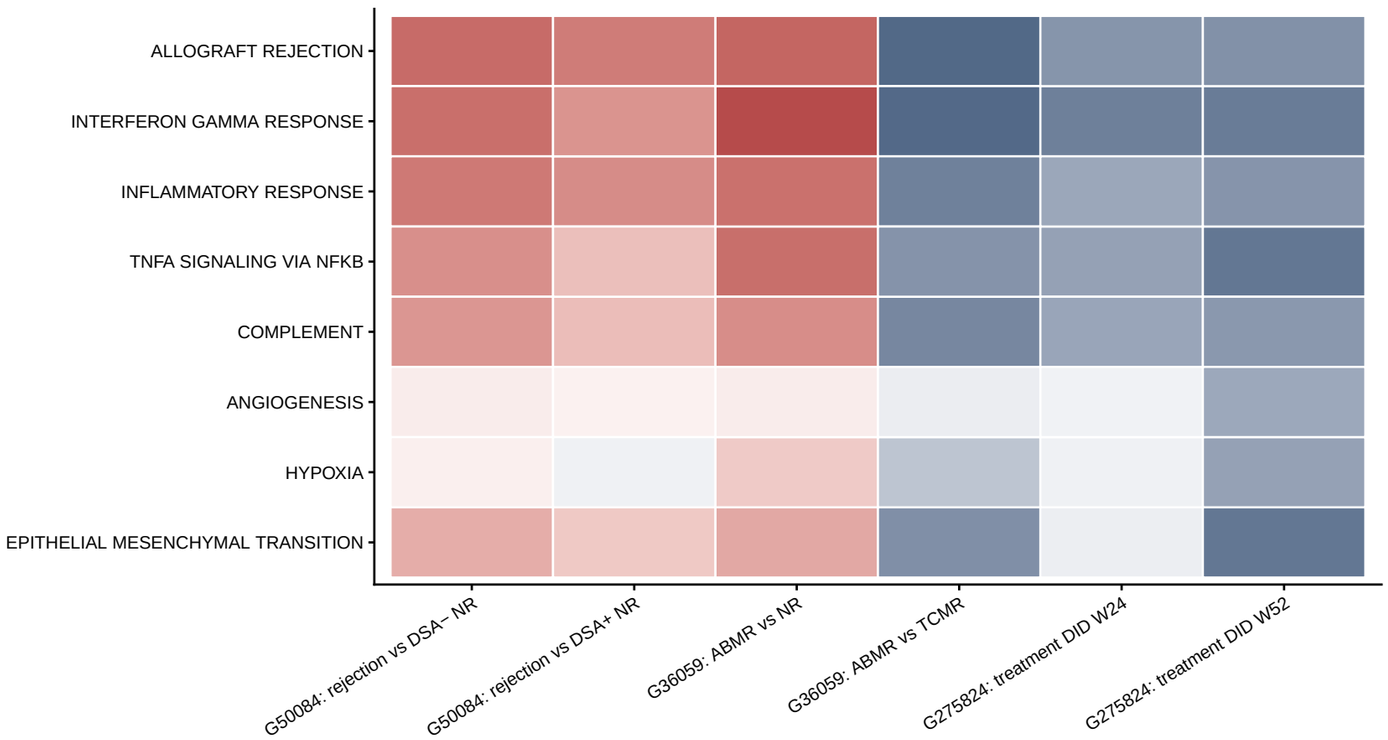
Color: ABMR − TCMR; purple means the program is stronger in TCMR





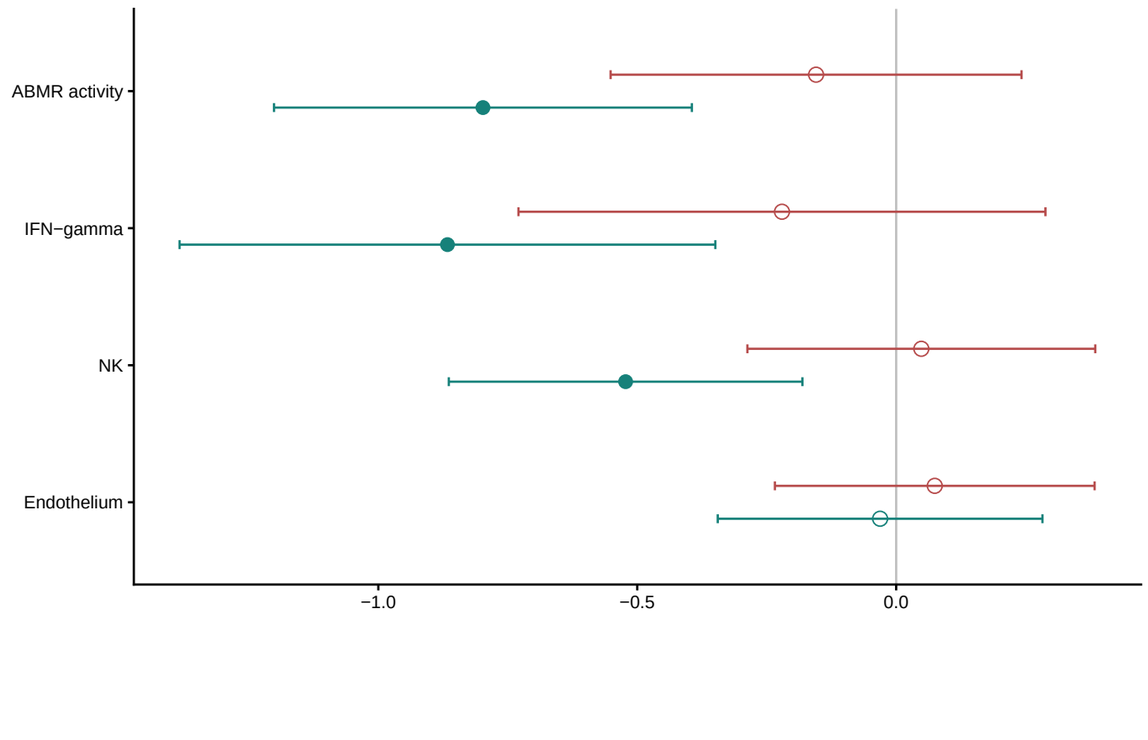
C Pathway direction across discovery, specificity and treatment

Red: enriched in first group; blue: enriched in control/placebo direction; opacity denotes BH FDR



D Randomized treatment effects are transient and program−dependent

Felzartamab−minus−placebo difference−in−differences; negative values indicate relative reduction



Associative bulk transcriptomics cannot prove antibody engagement, cell of origin, target causality, or drug efficacy.
