A Cohorts and biospecimens entering the study

Primary inference uses kidney−allograft biopsies; GSE50084 blood is retained but not pooled with tissue

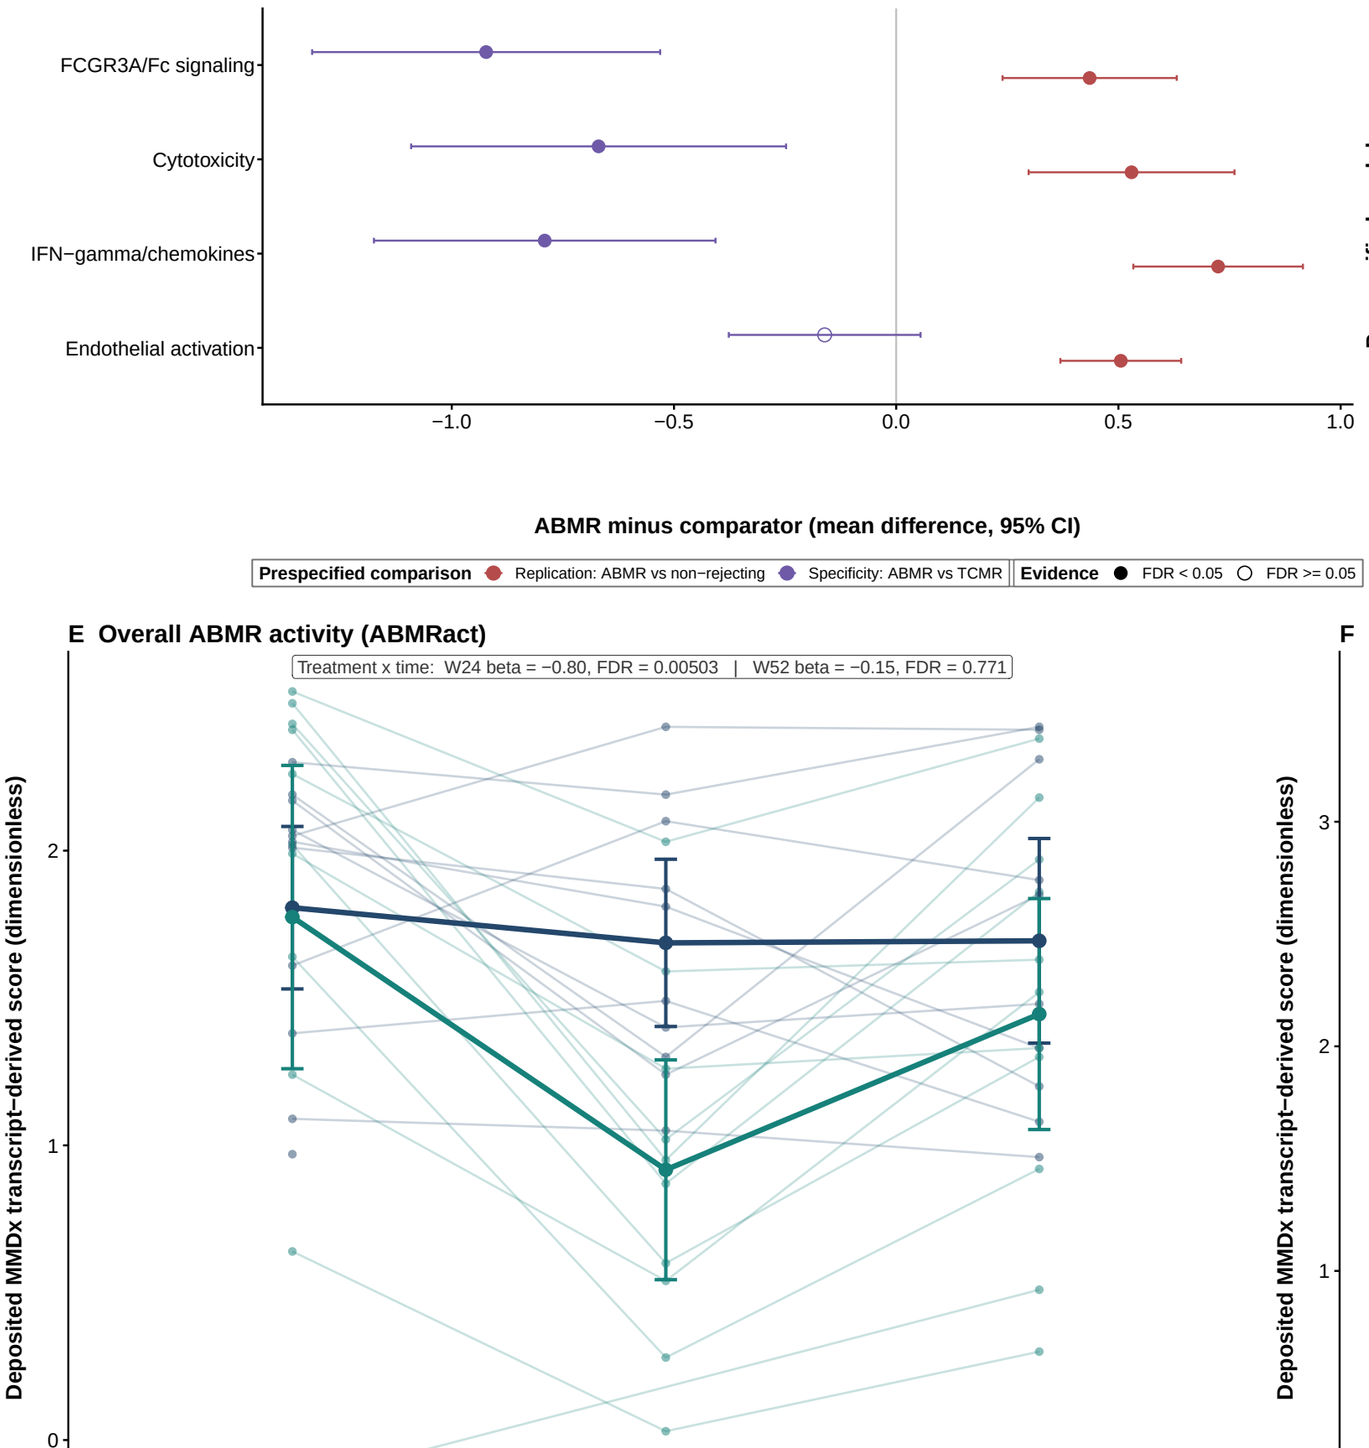

B GSE50084: DSA state is separated from rejection

Each point is one primary biopsy; DSA+ non−rejection is the difficult control

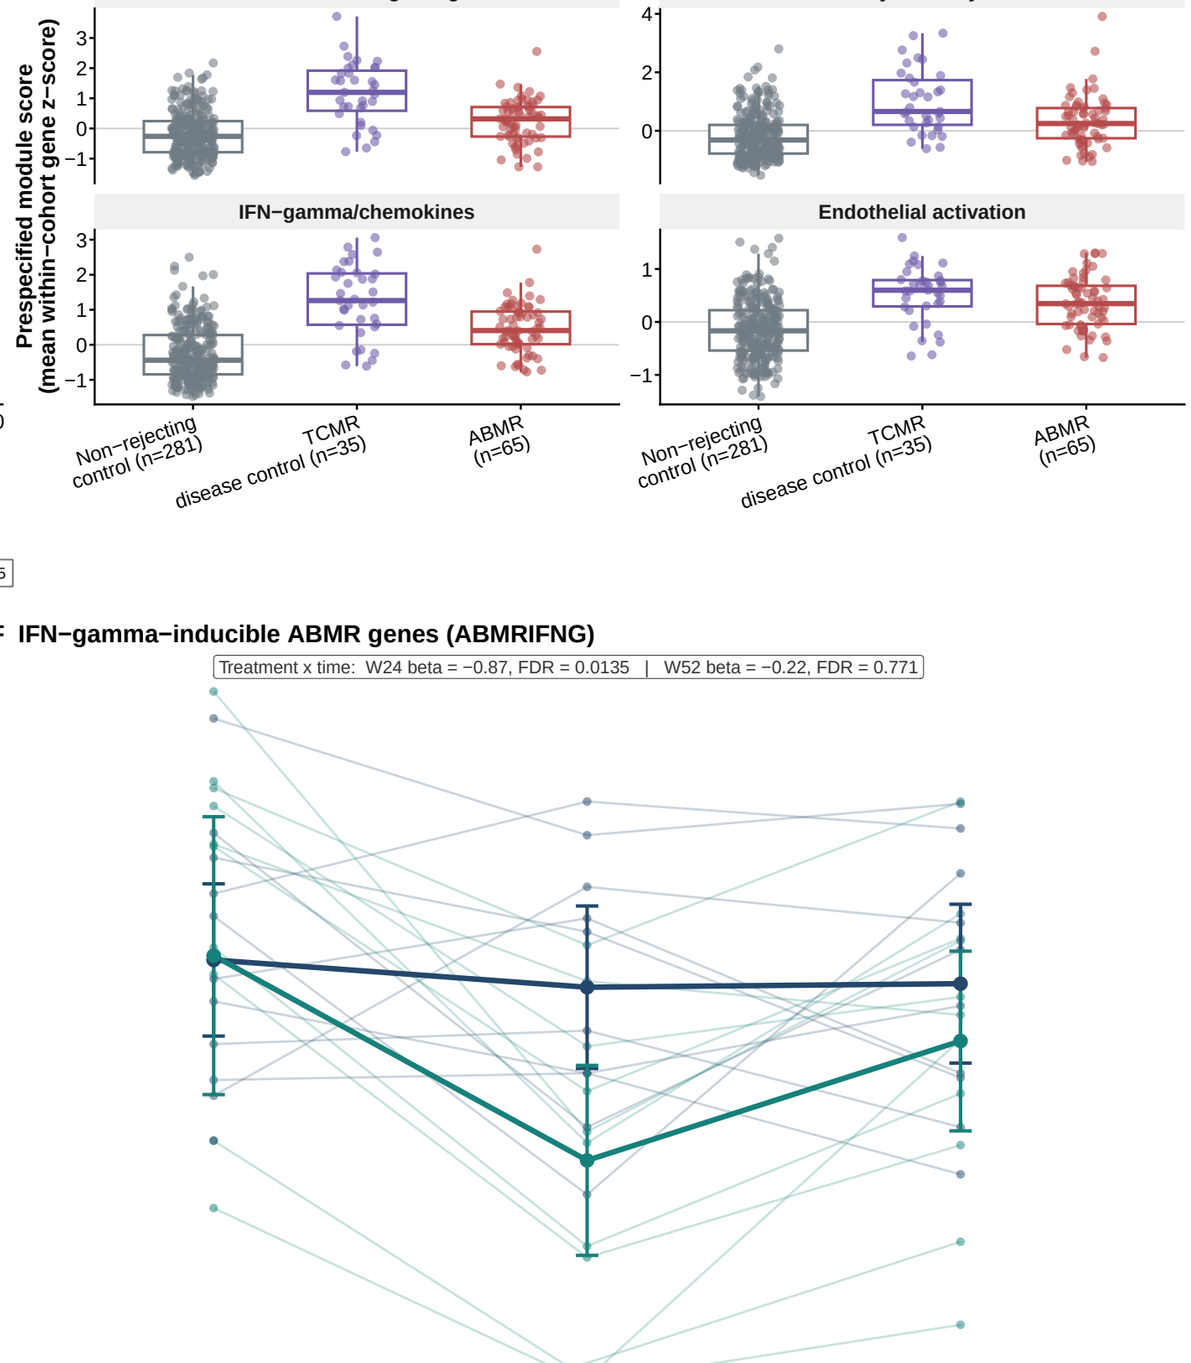

C Independent cohort: replication is not the same as specificity

GSE36059 kidney biopsies; right of zero means a higher module score in ABMR

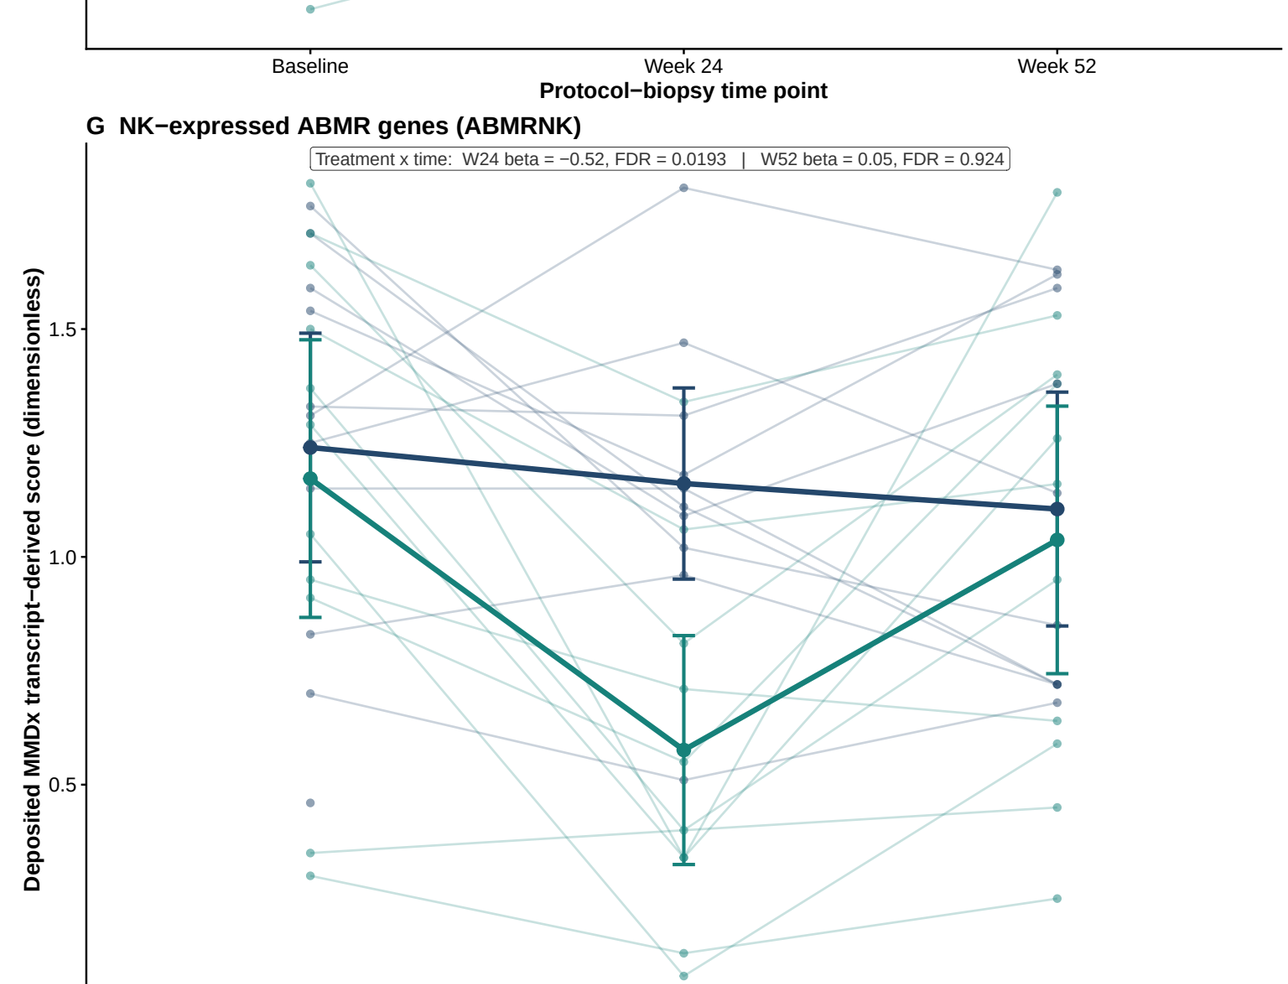

D GSE36059: observed biopsy−level module scores

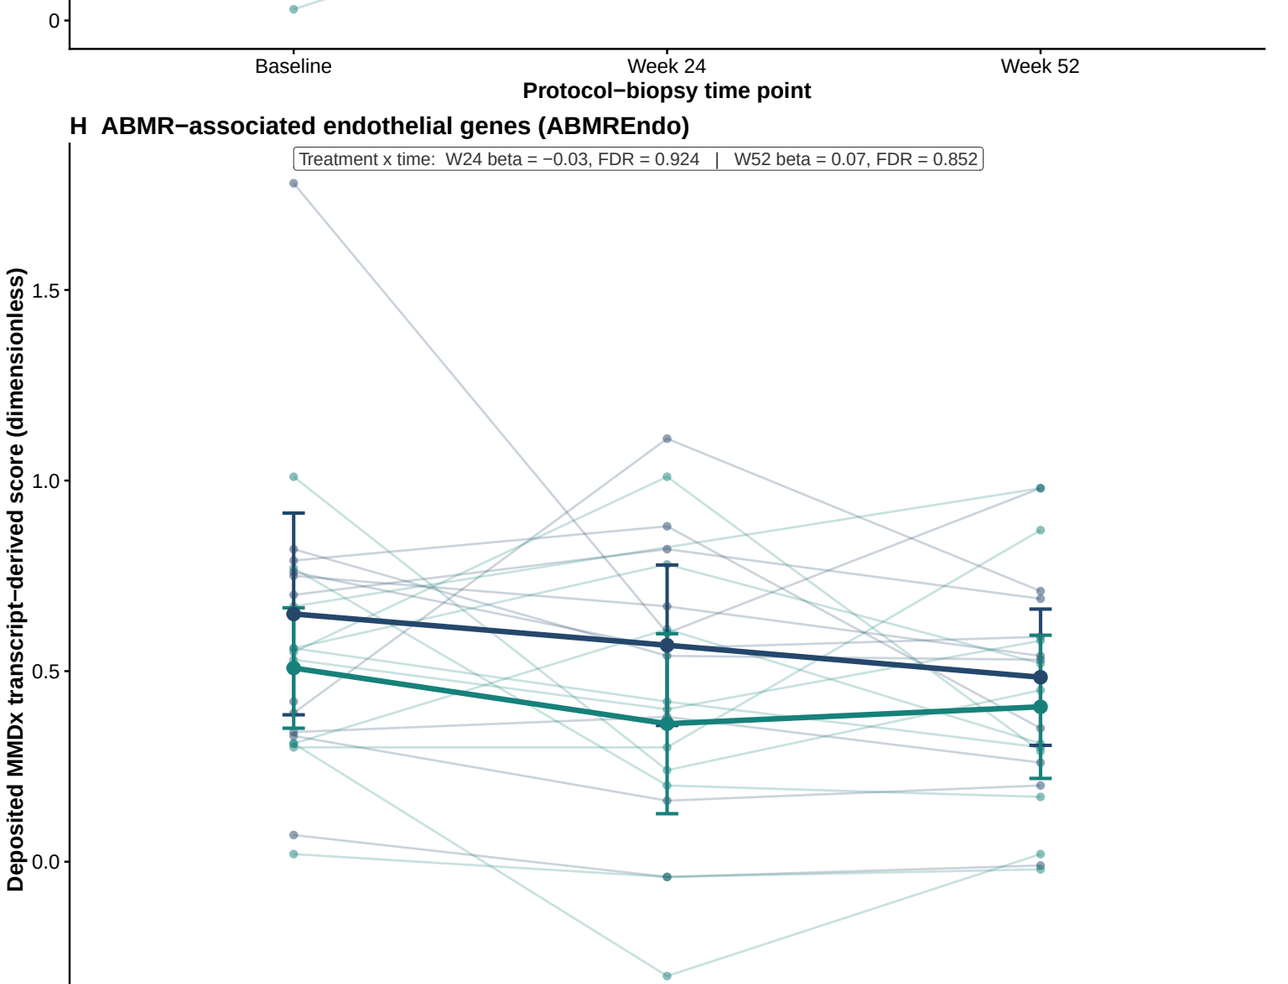

All 381 prespecified validation biopsies are displayed

E Overall ABMR activity (ABMRact)

F IFN−gamma−inducible ABMR genes (ABMRIFNG)

G NK−expressed ABMR genes (ABMRNK)

H ABMR−associated endothelial genes (ABMREndo)

Panels E−H use original deposited GSE275824 values. Thin lines are patients; thick lines are arm means with approximate 95% CI. Beta is the felzartamab−minus−placebo treatment−by−time interaction. Diebold et al., Nature Medicine 2025, doi:10.1038/s41591−025−03653−3.
