MOSAIC−Tx: observed multicohort evidence for ABMR−associated molecular programs

No simulated data: 61 GSE50084 biopsies, 381 prespecified GSE36059 biopsies, and 63 GSE275824 longitudinal biopsies

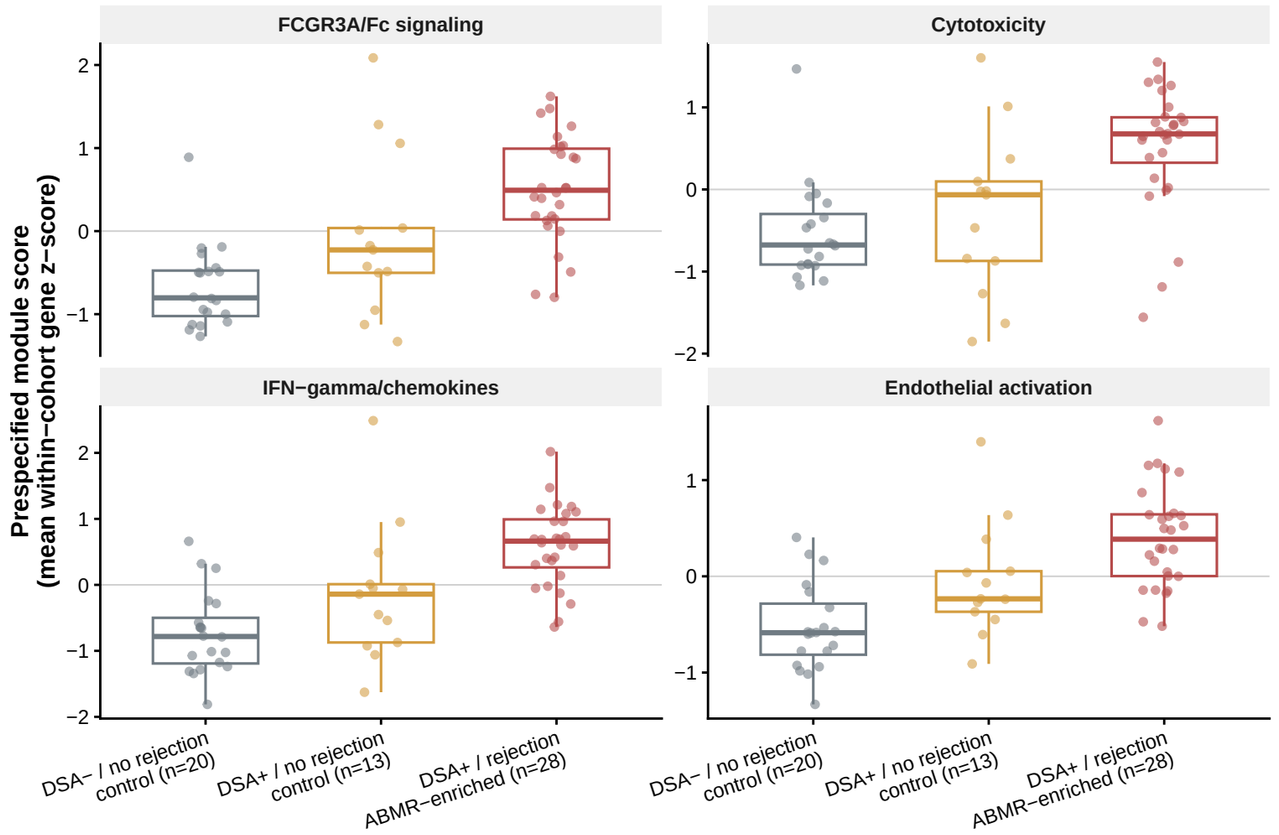

A GSE50084: 61 primary biopsies

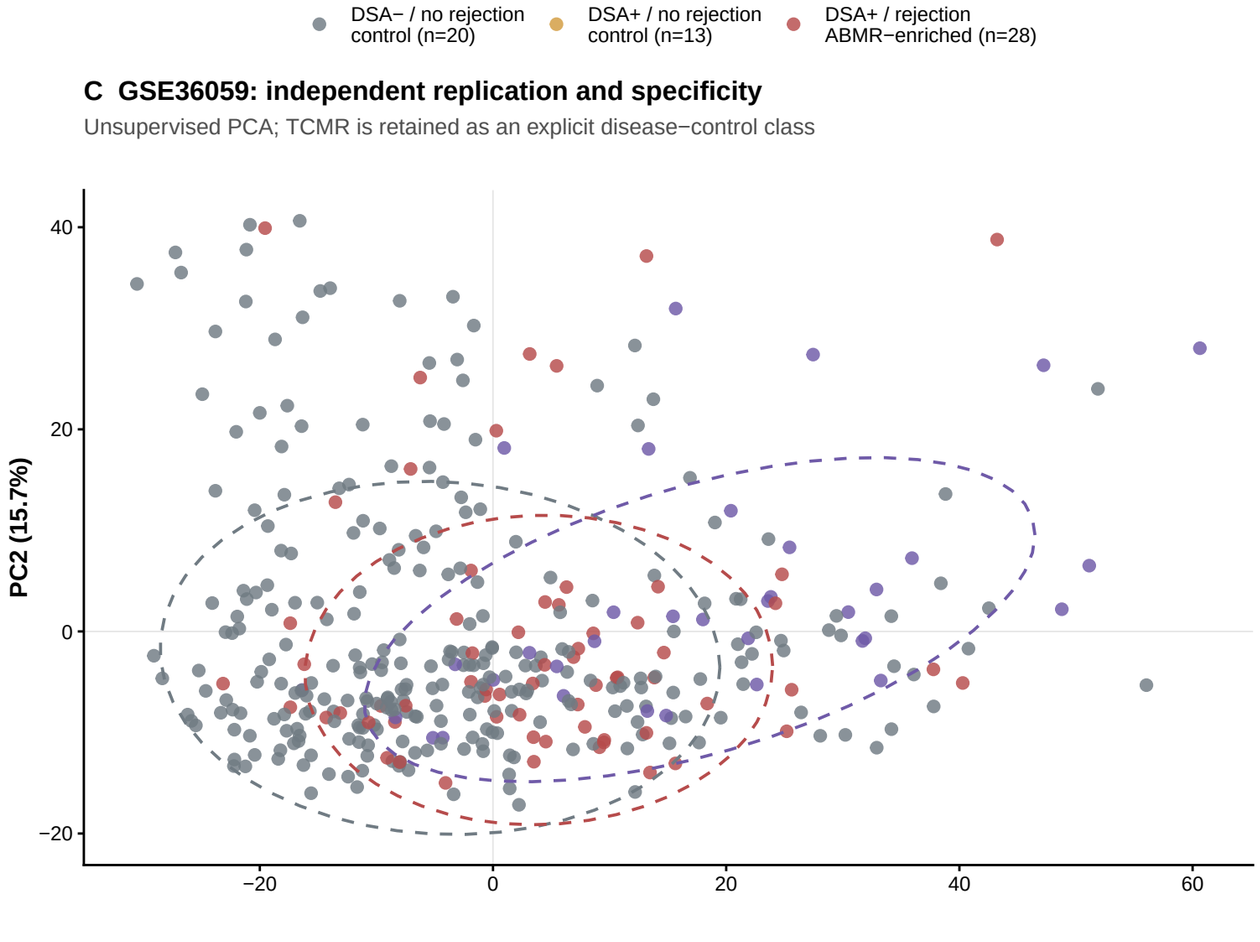

Unsupervised PCA of 1,000 most−variable genes; color labels are metadata−derived

B GSE50084: DSA state is separated from rejection

Each point is one primary biopsy; DSA+ non−rejection is the difficult control

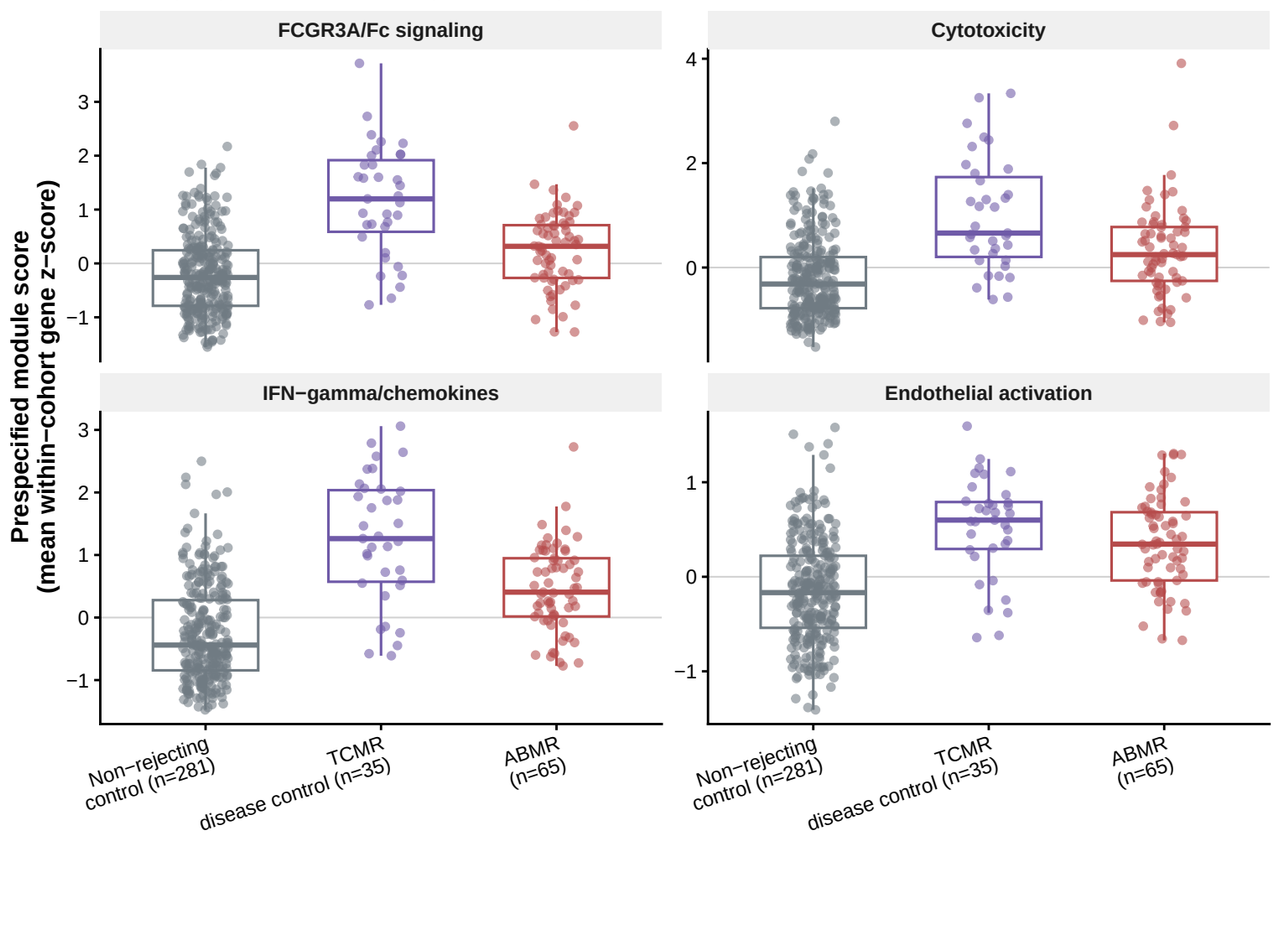

C GSE36059: independent replication and specificity

Unsupervised PCA; TCMR is retained as an explicit disease−control class

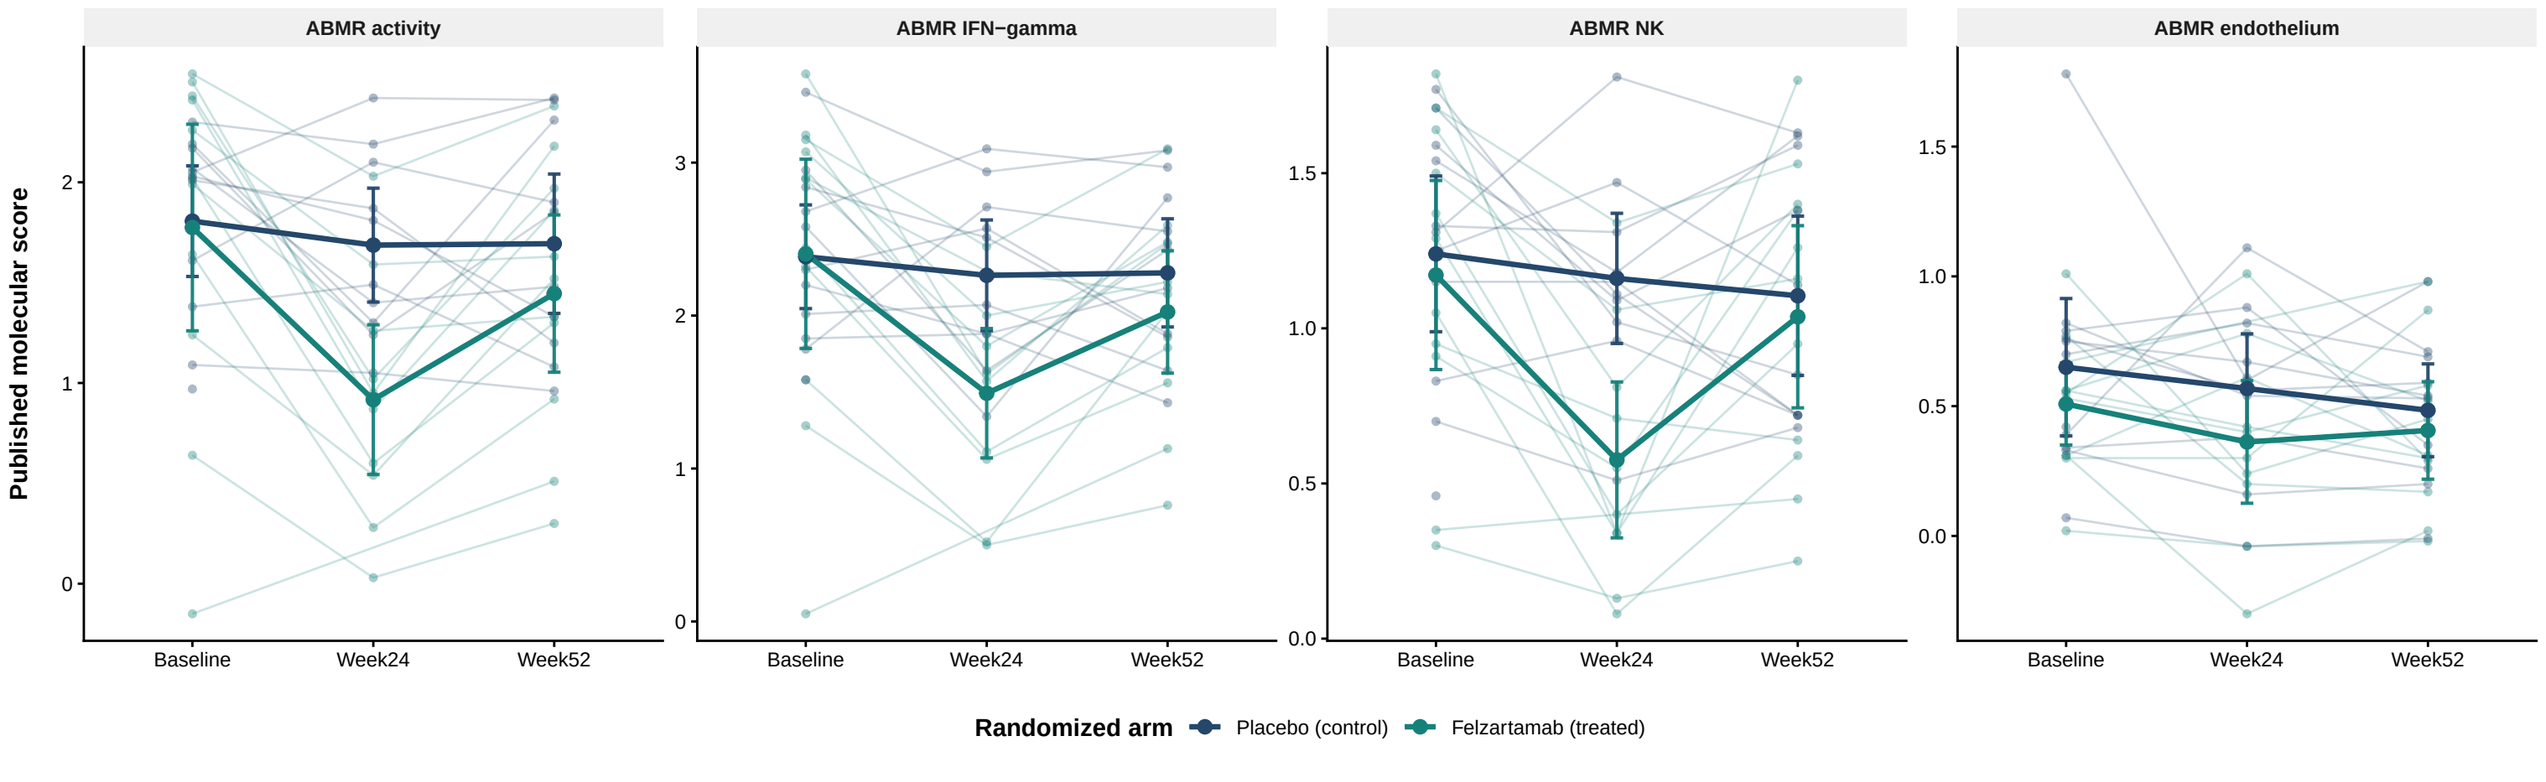

D GSE36059: observed biopsy−level module scores

All 381 prespecified validation biopsies are displayed

E GSE275824: randomized longitudinal response

63 biopsies from 22 patients; thin lines are patients, thick lines are group means ± approximate 95% CI

PCA and distributions are descriptive. Group labels come from public metadata. Bulk RNA cannot assign a program to a specific cell lineage or establish causality.
